## More than just a translator

Polina Zelenskaya Ekaterina Maksimova Ekaterina Urmanova Evsey Antonovich Daniyar Cherekbashev

## About us

Our goal is to create perfect real-time speech-to-speech translation

We utilize existing ML models to their full potential

## 19 languages

Already supported

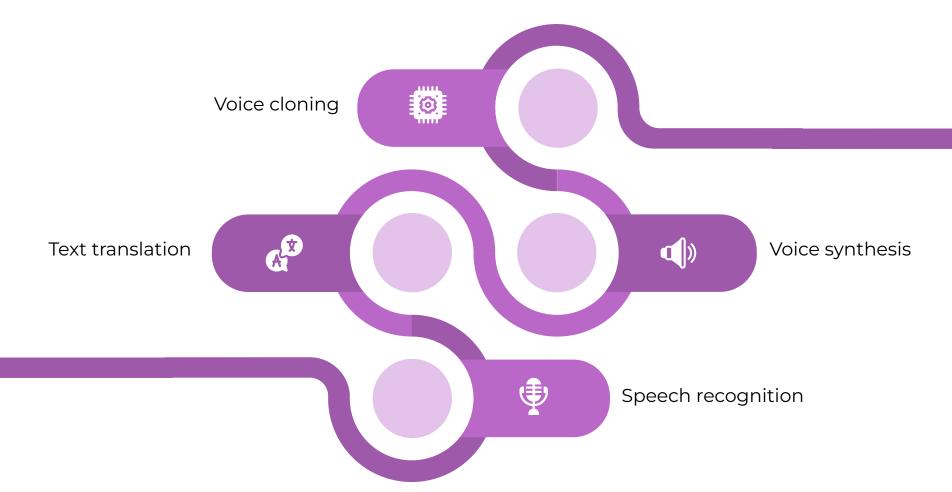

## 1.68 seconds

Average delay

## 100+ models

Flawlessly interact with each other

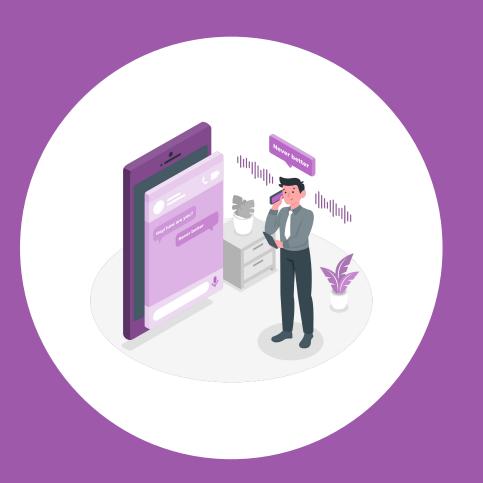

## 1

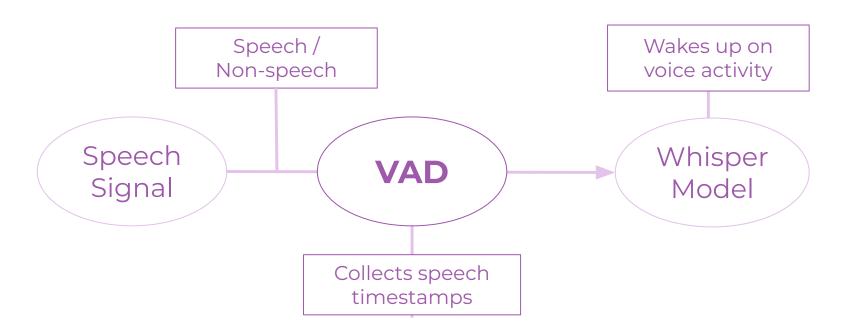

## **Speech-To-Text**

Place where it all begins

# How is audio processed?

## **Voice Activity Detection**

## **Whisper Models Comparison**

	Performance	Quality	Parameters
Tiny	Great	Very inaccurate	~39M
Medium	Great, on GPU	Accurate, but not perfect	~244M
Large-v2	Great, on decent GPU	Very accurate	~1550M

## 99 languages

Supported by all Whisper models

## 2 Text-To-Text

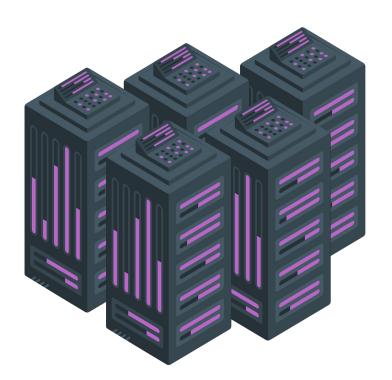

The place where translation happens

### **Translation Flow**

**Input Language** 

**Output Language** 

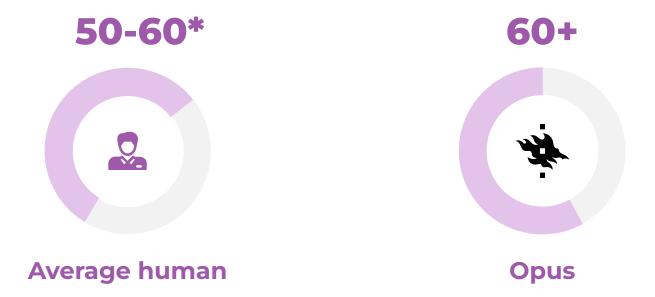

## It's free!

These models are publicly available for commercial use

### **Human Like translation**

<sup>\*</sup>BLEU score - how human like text is

## **High variety of languages**

1 1440 models
All publicly accessible

2 230 languages

Covering most of the Earth

### **Problems**

#### **Scalability**

Translation server may not keep up with a large number of active rooms

#### No context

Models do not take into account previous messages when translating

## 3

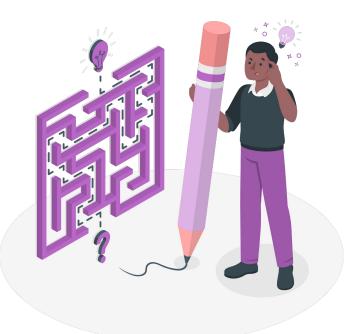

## **Voice cloning**

The cherry on top

# Lack of research!

All already-build solutions didn't fit. We need to create a real-time lightweight and customizable voice cloning pipeline

## **Decomposition**

**Piper** 

A fast, local neural text to speech system

FreeVC24

High-Quality, text-free, one-shot voice conversion

## 15 seconds

Of audio is sufficient to clone your voice

# Backend

The one server to rule them all

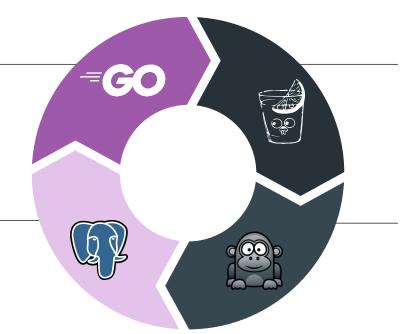

### **Tech stack**

Simple, yet capable; fast and reliable

#### **PostgreSQL**

Advanced open source relational database

#### **Gin-gonic**

Performant HTTP web framework

#### Gorilla

Widely-used websocket implementation

### **Data Security**

#### **JSON Web Tokens**

A modern approach to access tokens, used by OAuth 2.0

#### bcrypt

A robust password hashing function, resistant to rainbow table and brute force attacks

#### **Transport Layer Security**

Industry standard encryption for the web

## **User Interface**

How the user interacts with our app

### **UI tools**

- Python for fast development and iteration
- Dear PyGui for quick and painless UI development
- Dear ImGui underneath for robust functionality and minimalistic design

## **FUTURE**

How are we planning to grow, develop and improve

# Train Models

Right now models don't use previous messages to translate new ones. We want to create models that can use context for better translation

In addition, we need a voice conversion model lighter than the current FreeVC24

# Improve backend

Deploy our project to a cloud. Buy domain names. Expand functionality, improve modularity

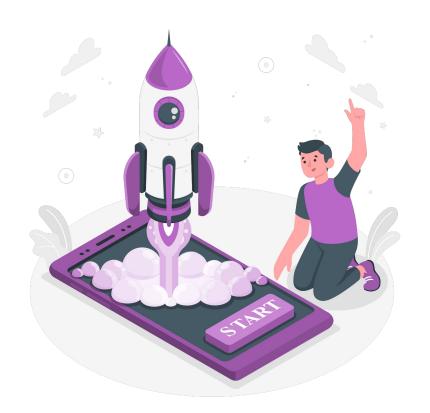

Add support for streaming sound for users with no GPU

# Fund & Launch

Reach out to investors and accelerators. Main goal - buy hardware for testing and development

Integrate with some services of Innopolis University

## More than just a translator
